

## API (VamAPI) - Setup

Download Link: <https://github.com/erev0s/VAmPI>

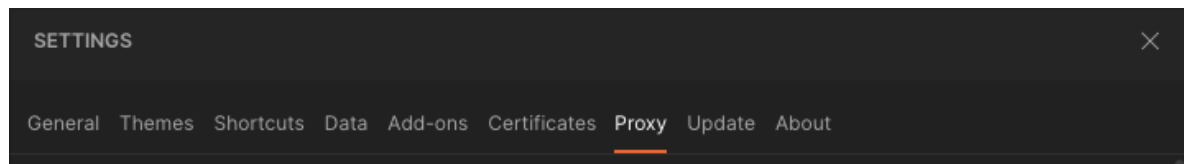

Download on Kali and Run it using Docker commands provided in GitHub.

Pre-requisites:

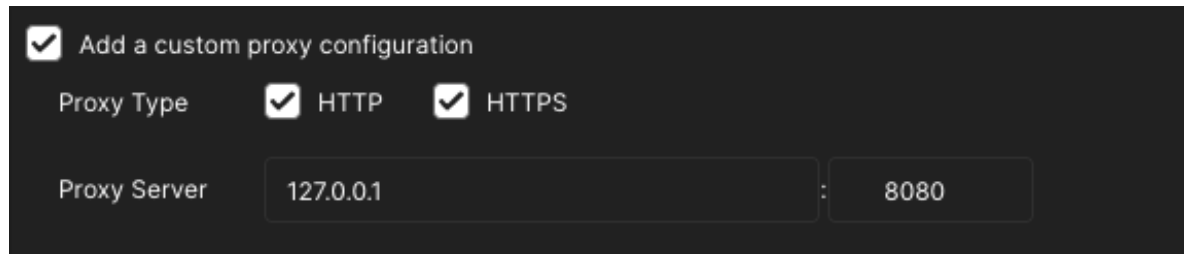

1. Install Postman
2. Install Burp (Community/Professional)

### Let's Begin with Setup:

1. Run Vampi using docker command and check by providing the <http://kaliip:5000>
2. Go to Github Vampi folder -> openapi\_specs folder.
3. Copy the content from "**VAmPI.postman\_collection.json**" file and past in one notepad file.
4. In the notepad file, we need to change the {baser} with your Kali IP address & save the file with .json extension.
5. Now, open Postman and Burpsuite for completing the setup of Proxy.
6. In Postman -> Click on Import and we will import the .json file.
7. Once imported, we will be able to see all the collection of different requests.
8. Now we need to set the proxy in Postman in order to capture request in Burp.

9. In Proxy section we will mention the proxy of Burp Suite I.e 127.0.0.1 8080

10. Now we will open Burp suite and in Postman we will send the request to make sure we are able to capture the request in Burp. If we check in target section we will be able to see the <http://kaliip:5000> in target section
